

Hello Team,

As some of my peers, I have decided to post to our cohort's slack channel as my current employer is very active on LinkedIn.

During this past week, we learned to manage computer files using the Command Line Interface, a quick history of Java and its 8 primitive data types, variables and data types, and uploading repositories to GitHub. I'm very excited about learning Git as it allows us to easily work as a team while sharing code with teammates, improve productivity, and given the fact it's the most widely tool of its kind, it's supported by many third-party software tools and services.

I also feel all the class videos were very informative and straight to the point, I'm very excited for the next few months in this quest to become a Back-end Software Developer.

Wishing the best of luck to all my classmates.
